NEW QUESTION: 4

Decision trees are a type of machine learning model that are used for classification and regression tasks. They are based on a series of decisions that split the data into smaller and smaller groups. The depth of the tree determines the variance of the model. A shallow tree has low variance and high bias, while a deep tree has high variance and low bias. The bias-variance tradeoff is the property of a set of predictive models whereby models with a lower bias in parameter estimation have a higher variance of the parameter estimates across samples, and vice versa.

Answer:

Explanation:

Explanation:

In decision trees, the depth of the tree determines the variance. A complicated decision tree (e.g. deep) has low bias and high variance.

Note: In statistics and machine learning, the bias-variance tradeoff is the property of a set of predictive models whereby models with a lower bias in parameter estimation have a higher variance of the parameter estimates across samples, and vice versa.

vers a. Increasing the bias will decrease the variance.
Increasing the variance will decrease the bias.
