**NEW QUESTION: 1**

You have Windows 8.1 images that are rebuilt quarterly and imported to System Center 2012 R2 Configuration Manager Service Pack 1 (SP1).

The Microsoft Deployment Toolkit (MDT) 2013 is integrated with Configuration Manager.

You need to reduce the network security risks when the images are deployed by using Operating System Deployment (OSD).

Which two tasks should you perform? Each correct answer presents a complete solution.

- A.** After the Apply Operating System Image task sequence step, add a Run Command Line step that runs wuaclt.exe /detectnow.
- B.** After the Apply Operating System Image task sequence step, add a step to install software updates offline.
- C.** After the installation of the final application, add an Install Software Updates task sequence step.
- D.** Before the Apply Operating System Image task sequence step, add a step to install the Windows Assessment and Deployment Kit (Windows ADK).
- E.** Before the Apply Operating System Image task sequence step, add a step to install Deployment Imaging Servicing and Management (DISM).

**Answer: B,C**

Explanation:

C: To do the updates offline to reduce network security risks.  
D: Install software updates to minimize network security risks  
Note: Configuration Manager 2012: Offline Servicing for  
Operating System Images In Configuration Manager 2012 there is  
a new feature for applying updates to operating system images  
while they are in the Configuration Manager library. This means  
any operating system image you see in the Operating Systems  
> Operating Systems Images node from the Software Library  
wunderbar can be updated with Component Based Servicing (CBS)  
updates. By updating an image in the Software Library instead  
of performing a new build and capture of the operating system  
image you will gain a few distinct advantages. You will be able  
to reduce the risk of vulnerabilities during operating system  
deployments and reduce the overall operating system deployment  
to the end user. You will also reduce the administrative effort  
to maintain your operating system images.

Task Sequence Steps in Configuration Manager The following task  
sequence steps can be added to a System Center 2012

Configuration Manager task sequence:

Install Software Updates Use the Install Software Updates task  
sequence step to install software updates on the destination  
computer. The destination computer is not evaluated for  
applicable software updates until this task sequence step runs.  
At that time, the destination computer is evaluated for  
software updates like any other Configuration Manager-managed  
client. In particular, this step installs only the software  
updates that are targeted to collections of which the computer  
is currently a member. This task sequence step runs only in a  
standard operating system. It does not run in Windows PE.

Deployment Image Servicing and Management (DISM) Technical  
Reference Deployment Image Servicing and Management (DISM) is a  
command-line tool that is used to mount and service  
[\[email#160;protected\]](#) images before deployment. You can use  
DISM image management commands to mount, and get information  
about, Windows image (.wim) files or virtual hard disks (VHD)  
and to capture, split, and otherwise manage .wim files.

Incorrect:

wuaclt.exe /detectnow

The detectnow switch will force a relatively immediate query to  
the WSUS server to see if there are any updates that are  
needed. If there are, the yellow shield will appear in the  
system tray. This is usually pretty quick, within 20-30  
seconds.
