UML is the Object Management Group Unified Modeling Language. The IT4IT definition of the Service Lifecycle Data Object aligns with what UML concept?

- A. Component
- B. Class
- C. Artifact
- D. Activity

Answer: C

Explanation:

A service lifecycle data object (lifecycle data object) represents data (records, information, and so on) that annotate or model an aspect of a service being offered by IT. Data objects can take a digital or physical form and can be comprised of structured, semi-structured, or unstructured data. Our definition of service lifecycle data object is aligned contextually with the OMG definition of artifact. In UML, the OMG defines artifact as:

"The specification of a physical piece of information that is used or produced by a software development process, or by deployment and operation of a system. Examples of artifacts include model files, source files, scripts, and binary executable files, a table in a database system, a development deliverable, or a word-processing document, a mail message."

NEW QUESTION: 4

An EtherChannel bundle has been established between a Cisco switch and a corporate web server. The network administrator noticed that only one of the EtherChannel links is being utilized to reach the web server.

What should be done on the Cisco switch to allow for better EtherChannel utilization to the corporate web server?

- A. Adjust the EtherChannel load-balancing method based on source IP addresses.
- B. Use link-state tracking to allow for improved load balancing of traffic upon link failure to the server.
- C. Adjust the EtherChannel load-balancing method based on destination IP addresses.

D. Disable spanning tree on all interfaces that are participating in the EtherChannel bundle.

E. Enable Cisco Express Forwarding to allow for more effective traffic sharing over the EtherChannel bundle.

Answer: A

Explanation:

Explanation/Reference:

Explanation:

EtherChannel load balancing can use MAC addresses, IP addresses, or Layer 4 port numbers, and either source mode, destination mode, or both. The mode you select applies to all EtherChannels that you configure on the switch. Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel only goes to a single MAC address (which is the case in this example, since all traffic is going to the same web server), use of the destination MAC address results in the choice of the same link in the channel each time. Use of source addresses or IP addresses can result in a better load balance.
