NEW QUESTION: 4
As part of your continuous deployment process, your application undergoes an I/O load performance test
before it is deployed to production using new AMIs. The application uses one Amazon Elastic Block Store
(EBS) PIOPS volume per instance and requires consistent I/O performance. Which of the following must be
carried out to ensure that I/O load performance tests yield the correct results in a repeatable manner?
A. Ensure that the Amazon EBS volumes have been pre-warmed by reading all the blocks before the test.
B. Ensure that the Amazon EBS volume is encrypted.
C. Ensure that the I/O block sizes for the test are randomly selected.
D. Ensure that snapshots of the Amazon EBS volumes are created

as a backup.
Answer: A
Explanation:
Explanation
During the AMI-creation process, Amazon CC2 creates snapshots of your instance's root volume and any
other CBS volumes attached to your instance
New CBS volumes receive their maximum performance the moment that they are available and do not require
initialization (formerly known as pre-warming).
However, storage blocks on volumes that were restored from snapshots must to initialized (pulled down from
Amazon S3 and written to the volume) before you can access the block. This preliminary action takes time and
can cause a significant increase in the latency of an I/O operation the first time each block is accessed. For
most applications, amortizing this cost over the lifetime of the volume is acceptable.
Option A is invalid because block sizes are predetermined and should not be randomly selected.
Option C is invalid because this is part of continuous integration and hence volumes can be destroyed after the
test and hence there should not be snapshots created unnecessarily
Option D is invalid because the encryption is a security feature and not part of load tests normally.
For more information on CBS initialization please refer to the below link:
