Answer: B,E
Explanation:
Explanation
A VPC endpoint enables you to privately connect your VPC to
supported AWS services and VPC endpoint services powered by AWS
PrivateLink without requiring an internet gateway, NAT device,
VPN connection, or AWS Direct Connect connection. Instances in
your VPC do not require public IP addresses to communicate with
resources in the service. Traffic between your VPC and the
other service does not leave the Amazon network.
Gateway endpoints
A gateway endpoint is a gateway that you specify as a target
for a route in your route table for traffic destined to a
supported AWS service. The following AWS services are
supported:
Amazon S3
DynamoDB

Answer: A
Explanation:
https://docs.aws.amazon.com/codedeploy/latest/userguide/deploym
ent-groups.html

"You can associate more than one deployment group with an application in CodeDeploy. This makes it possible to deploy an application revision to different sets of instances at different times. For example, you might use one deployment group to deploy an application revision to a set of instances tagged Test where you ensure the quality of the code. Next, you deploy the same application revision to a deployment group with instances tagged Staging for additional verification. Finally, when you are ready to release the latest application to customers, you deploy to a deployment group that includes instances tagged Production. "
