NEW QUESTION: 2
Which two of these functions do routers perform on packets?
(Choose two.)
A. Update the Layer 2 headers of outbound packets with the MAC addresses of the next hops
B. Examine the Layer 2 headers of inbound packets and use that information to determine the next hops for the packets
C. Update the Layer 3 headers of outbound packets so that the packets are properly directed to valid next hops

D. Examine the Layer 3 headers of inbound packets and use that information to determine the next hops for the packets
E. Examine the Layer 3 headers of inbound packets and use that information to determine the complete paths along which the packets will be routed to their ultimate destinations
F. Update the Layer 3 headers of outbound packets so that the packets are properly directed to their ultimate destinations
Answer: A,D
Explanation:
This is the basic function of the router to receive incoming packets and then forward them to their required destination. This is done by reading layer 3 headers of inbound packets and update the info to layer 2 for further hopping.

NEW QUESTION: 3
To complete the sentence, select the appropriate option in the answer area.

Answer:
Explanation:

Explanation
Azure Activity Log

NEW QUESTION: 4
Which one of the statements describes a service aggregator pattern?
A. It uses a queue on both sides of the service communication
B. It is implemented in each service separately and uses a streaming service
C. It involves sending events through a message broker
D. It involves implementing a separate service that makes multiple calls to other backend services
Answer: D
Explanation:
Explanation
Service Aggregator Pattern
Another option for eliminating microservice-to-microservice coupling is an Aggregator microservice, shown in purple in Figure 4-10.

The pattern isolates an operation that makes calls to multiple back-end microservices, centralizing its logic into a specialized microservice. The purple checkout aggregator microservice in the previous figure orchestrates the workflow for the Checkout operation. It includes calls to several back-end microservices in a sequenced order. Data from the workflow is aggregated and returned to the caller. While it still implements direct HTTP calls, the aggregator microservice

reduces direct dependencies among back-end microservices.
